

Laboratory 1

TASKS TO BE CARRIED OUT

1. Check information about the CPU cores (using the shell command). Make a print-screen of the results and put it on e-nauczanie. (0.5 points)
2. Write bash script files: Using the shell commands create 4 new processes. New processes should write "Hello you", then wait 5 seconds and next write "Bye bye!". Put the scripts on e-nauczanie. Make a print-screen of the results (use shell command to obtain information of running processes) and put it on e-nauczanie. (1 point)
3. Write a program in C language: Create 8 processes using fork and exec. New processes should write their id. Remember to wait for child processes termination. Put the code of the program on e-nauczanie. Make a print-screen of the results (use shell command to obtain information of running processes) and put it on e-nauczanie. (1 point)
4. Write a program in C language: Create 6 new processes. Send a signal from parent process to child processes (a current date). Next, the new processes should send a signals to the parent process (their id). Remember to wait for child processes termination. Put the code of the program on e-nauczanie. Make a print-screen of the results (use shell command to obtain information of running processes) and put it on e-nauczanie. (1.5 points)
5. Create a zombi process (write a program in C language), use shell command to obtain information of running processes and then kill it. Put the code of the program on e-nauczanie. Make a print-screen of the results and put it on e-nauczanie. (1 point)
